

PRODUCT OVERVIEW

A secure document portal for **accounting firms** and their clients.

Accountants spend hours chasing clients for paperwork that arrives as messy email attachments, phone photos, and scattered files. Capsule replaces that chaos with one organized, branded, self-service portal — clients drop documents in, accountants get them neatly filed, tracked, and secure.

How it works

01

THE FIRM

Invite a client

The accountant creates a client and sends a one-time invite link. The client sets their own password — no email setup required.

02

THE CLIENT

Upload documents

The client lands in their own private workspace and uploads statements, invoices, and receipts, tagging each by category.

03

THE FIRM

Review & act

Documents auto-organize by period and category. The accountant reviews, comments, tracks status, and exports whole periods.

Who uses it

Accountants

See a grid of all their clients, open any one, and work through their documents — review status, request missing items, comment, and bulk-export.

Clients

Get a simple, private workspace to upload and track their own documents — and nothing else. No clutter, no access to anyone else's files.

What it does

Auto-grouping by period

Documents file themselves by year, quarter, or month — configurable per firm.

Firm-defined categories

Each firm sets its own document categories (bank statement, payroll, VAT...).

Status workflow

Track every document: submitted → under review → needs correction → accepted.

Comments & requests

Accountant and client discuss a document, and firms can request missing items.

Upload timeline

A chronological view of everything a client has submitted, at a glance.

Bulk period export

Download an entire period's documents as a single zip for filing or archiving.

Built-in isolation & security

- ✓ **Client vs. client** — each client sees only their own documents.
- ✓ **Multi-tenant** — many firms share one instance, fully walled off.
- ✓ **HTTPS everywhere** — encrypted, with automatic certificate renewal.
- ✓ **Firm vs. firm** — no firm can see another firm's clients or data.
- ✓ **Enforced access control** — permissions checked on every document.
- ✓ **Invite links are one-time** — and expire once a password is set.

Built on: Mayan EDMS — a mature open-source document management engine — with a modern IBM Carbon Design interface, containerized with Docker and served over HTTPS.
